#### Learning Goals / Competences Professional competence (professional knowledge and skills, professional expertise): Students will be able to apply and perform the basic concepts and applications of inferferometry and optical measurement techniques. They will be able to interpret and discuss the results as well as alternative methods and solutions. The Students are able to choose and specify suitable interferometric setups for different applications, choose and specify suitable light sources, sensors and components for interferometric setups and applications and design an interferometric setup for different applications by means of the learned methods and information. They can specify and select the principles of fringe analysis and the appropriate assessment techniques. They are able to select a suitable calibration technique to qualify an interferometer and are able to specify the range, resolution and accuracy of an interferometric setup. They are able to apply the methods listed above in the lab and analyze and review critical the results Over professional competence (social skills und ability to work independently): Students can discuss and debate in groups about specific problems and about the best solutions and applications related to a particular measurement problem. Special (methods) skills, if applicable: They are enabled to systematically select the suitable metrology setup for various measurement problems. Concentration Mini-Concentration **In Small Amounts** Competence Area **Professional Competence Methods Competence Social Competence Teaching Contents** Lecture: Basic principles of interference Interferometers Detection techniques and algorithms Calibration techniques Accuracy and error sources Testing the quality of optical materials Examples for Application of Interferometry Testing the geometry of optical components Language ☐ German ⊠ English Spanish French Chinese Portuguese Russian Other: Literature Hand-out, detailed manuscript with exercises Dörband, Müller, Gross: "Handbook of Optical Systems, Vol. 5" Hecht "Optics" (Fundamentals) Malacara "Optical Shop Testing" **Composition of the Final** 50 % PLP,50 % PLM (20 min) Mark Comments / Other

Learning Goals / Competences	<u> </u>								
competence:									
·									
The students can describe and use their knowledge of fiber optic communication systems, the structure and properties of the corresponding components.  Students will be able to obtain basic data about signal power and noise by evaluation.									
The students are able to expand their knowledge and develop new consolidating insights. They are able to answer, evaluate and develop questions on the individual topics.									
soft skills and self-reliance:									
The student  is able to understand and has an increased ability	d handle complex problem to abstract thinking	s and experiments							
special (methods) skills, if applic	able:								
Students can analyze literature a	and distinguish between re	levant and irrelevant infor	mation.

Learning Goals / Competence	<u>!S</u>								
Professional competence (professional knowledge and skills, professional expertise): The students are able to inform about elements of photonic specific signal chains at the interface between optical and electronic signals. They can select suitable optical sensors for certain applications. Under practical aspects, they can set up appropriate electronics for signal preprocessing of the optical sensor signals. They are able to analyze and implement circuits for photonic applications. Students can calculate signal transmission characteristics and perform noise analyses.									
Translated with www.DeepL.cor	m/Translator								
	Over professional competence (social skills und ability to work independently): Students can put theoretical knowledge into practical laboratory work, work in teams and write laboratory reports.								
Special (methods) skills, if applicable: The students are able to analyze and construct electronic circuits or systems with a focus on photonic applications. They are able to design circuits taking into consider a non-ideal behavior of the circuit elements. Furthermore, basic integrated circuits and discrete electronics can be adapted to the special needs of photonic applications.

Learning Goals / Competence	Learning Goals / Competences										
The students can apply a detailed and well-founded knowledge in the technologies of laser material processing. They can develop advanced principles of the technologies, optimize processes, distinguish suitable lasers and develop complex and modified experimental set-ups for practical work.											
The students could discuss and explain the advantages and disadvantages of different methods. They can express themselves scientifically and apply their specialist language skills.											
Students can analyse and interpret scientific papers and corresponding literature and combine them with the content of the lecture.

Learning Goals / Competences									
Professional competence (prof	essional knowled	ge and skills, p	orofessional expertise	):					
Students can understand the lighting in a basic way. They can describe their knowledge of phenomena that describe the interaction of light waves in optical systems. This allows them to represent the difference between beam and wave optics. This will allow students to see the limits and describe improved optical effects. In addition, students can apply simulation software and transfer their understanding of lighting system design. Special (methods) skills, if applicable:									
Students are able to analyse lit		nguish betweer	n relevant and irreleva	int information. They can					
evaluate and judge optical phe Over professional competence		ability to work	independently):						
They can discuss and evaluate	the advantages	and disadvanta		paches in a team. They can					
express themselves scientifical			Medium	Limbé

### Allowed Exam Materials/ Restictions

- slides of presentation in English all parts of the thesis has to be performed individually; participation of more than one student is not permitted; each student works on its one topic.

Learning Goals / Competence	Learning Goals / Competences							
The students can apply the contents of the curriculum independently in a scientific paper. They can analyse demanding specialist literature. They can analyse and evaluate the results and carry out experimental measurements in research areas. They are able to defend the results of the Master's thesis in an oral presentation and document them in a written report.								
Competence Area	Heavy	Medium	Light
